## When data is not perfectly symmetric

Noisy observations Unknown external forces Unknown boundary conditions Observations not aligned with symmetry or symmetry breaking background

## **Group Convolution Networks**

Lift Convolution Layer:

 $f_{out}(\boldsymbol{x},r) = (f_{in} * \psi)(\boldsymbol{x}) = \sum_{\boldsymbol{y} \in \mathbb{Z}^2} f_{in}(\boldsymbol{y}) \psi_r(\boldsymbol{y} - \boldsymbol{x}), \quad (\boldsymbol{x},r) \in \mathbb{Z}^2 \rtimes C_4$

 $f_{out}: \mathbb{Z}^2 \rtimes C_4 \to \mathbb{R}$ 

## **Group Convolution Networks**

**Group Convolution Layer:** 

 $f_{out}(x,r) = (f_{in} * \psi)(x,r) = \sum_{r' \in C_4} \sum_{y \in \mathbb{Z}^2} f_{in}(y,r) \psi(r^{-1}(y-x),r^{-1}r'), \ (x,r) \in \mathbb{Z}^2 \rtimes C_4$ 

 $f_{in}:\mathbb{Z}^2\rtimes C_4\to\mathbb{R}$

$$[f \star \psi](g) = \sum_{h \in G} f(h)\psi(g,h) = \sum_{h \in G} \sum_{l=1}^{L} f(h)\psi(g,h) = \sum_{h \in G} \sum_{l=1}^{L} f(h)\psi(g,h) = \sum_{h \in G} f(h)\psi(g,h) = \sum_{h \in$$

 $f(h)w_l(h)\psi_l(g^{-1}h),$ 

Proposition (informal): The relaxed weights will learn to be distinct across group elements during training in a way such that the model is equivariant to  $Stab(X) \cap Stab(Y)$

- $\checkmark$  Relaxed group convolution networks always maintain the highest level of equivariance that is consistent with data.
- ✓ The relaxed weights can be used to discover the symmetry and symmetrybreaking factors in the data.
- Superior performance on turbulence super-resolution and predictions.
- $\checkmark$  Future works including investigating the benefits of relaxed weights in optimization and finding more potential in material science.
